

TOPIC: CONFIDENCE INTERVALS FOR VARIANCE

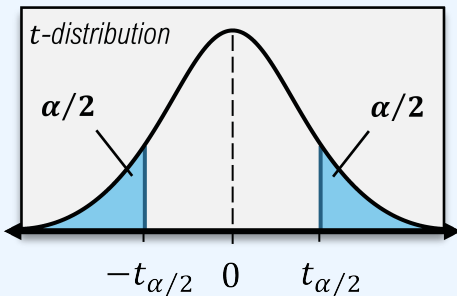

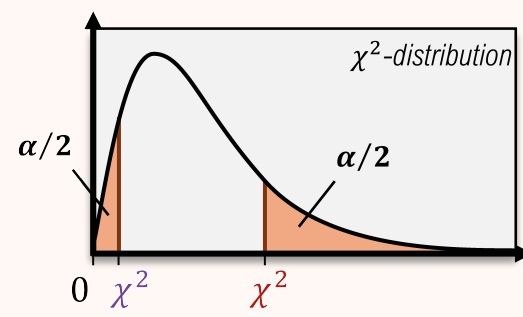

Constructing Confidence Intervals for Variance or Standard Deviation

◆ To make a C.I. for σ^2 , use ____ as a point estimate & ____ critical values from the χ^2 distribution.

► Since χ^2 is NOT symmetric, there's NO margin of error. Use **right** χ_R^2 & **left** χ_L^2 to find **lower** and **upper** bounds.

EXAMPLE

A farmer wants to know how much the weights of eggs from her chickens vary. A normally distributed sample of 12 eggs has $s^2 = 1.2 \text{ g}^2$. Construct a 90% confidence interval for the true variance of egg weights.

Recall	C.I. for Mean	New	C.I. for Variance
	 $E = t_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}$ $\bar{x} - E < \mu < \bar{x} + E$	 $\frac{(n-1)s^2}{\chi_R^2} < \sigma^2 < \frac{(n-1)s^2}{\chi_L^2}$ * verify sample is normal $\text{_____} < \sigma^2 < \text{_____}$	Recall $df = n - 1$ $n = \text{_____}$ $df = \text{_____}$ $s^2 = \text{_____}$
		$1 - \alpha/2 = \text{_____}$ $\chi_L^2 = \text{_____}$	$\alpha/2 = \text{_____}$ $\chi_R^2 = \text{_____}$

◆ For C.I. of standard deviation σ , take sqrt of both sides:

$$\frac{(n-1)s^2}{\chi_R^2} < \sigma^2 < \frac{(n-1)s^2}{\chi_L^2}$$

TOPIC: CONFIDENCE INTERVALS FOR VARIANCE

PRACTICE

What is wrong with expressing the confidence interval $3.8 < \sigma^2 < 6.4$ as $\sigma^2 = 5.1 \pm 1.3$?

- A) 5.1 is not the midpoint between 3.8 and 6.4.
- B) The values 3.8 and 6.4 are impossible because variance must be less than 3.
- C) The point estimate for σ^2 is not the midpoint of a confidence interval and 1.3 is not a margin of error since the χ^2 distribution is asymmetric.
- D) Confidence intervals can only be written for means or proportion, not for variance.

PRACTICE

A delivery service tracks the weights of its packages. A sample of 20 packages has a variance of 4.5 lbs². Construct a 95% conf. int. for the population variance. Assume a normal distribution.

Recall

$$\frac{(n-1)s^2}{\chi^2_R} < \sigma^2 < \frac{(n-1)s^2}{\chi^2_L}$$
$$P(X^2 > \chi^2_R) = \frac{\alpha}{2} \quad P(X^2 > \chi^2_L) = 1 - \frac{\alpha}{2}$$
$$df = n - 1$$

TOPIC: CONFIDENCE INTERVALS FOR VARIANCE

EXAMPLE

A quality control specialist takes a sample of $n = 30$ parts from an assembly line and finds a sample variance of $s^2 = 1.2 \text{ mm}^2$ in part length. Assume normally distributed population.

(A) Make a 90% confidence interval for the population variance in part length (σ^2).

Recall

$$\frac{(n-1)s^2}{\chi_R^2} < \sigma^2 < \frac{(n-1)s^2}{\chi_L^2}$$
$$P(X^2 > \chi_R^2) = \frac{\alpha}{2} \quad P(X^2 > \chi_L^2) = 1 - \frac{\alpha}{2}$$
$$df = n - 1$$

(B) Make a 99% confidence int. for σ^2 . How does increasing the *confidence level* affect the *interval width*?

TOPIC: CONFIDENCE INTERVALS FOR VARIANCE

EXAMPLE

A business analyst is reviewing the daily revenue (in \$1,000s) for a product over 16 days, recorded in the table below. Assume revenue follows a normal distribution.

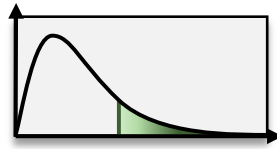

Daily Revenue (\$1,000s)							
12.5	12.3	12.9	12.6	12.4	12.7	12.8	12.6
12.5	12.7	12.4	12.9	12.3	12.5	12.6	12.7

(A) Construct a 90% confidence interval for the population standard deviation of daily revenue.

(B) The company's finance team states that daily revenue should have a standard deviation of no more than \$0.2k (\$200) to maintain forecast accuracy for budgeting and inventory planning. Should the analyst recommend reviewing sales processes or forecasting models?
