CONCEPT: THE IDEAL GAS LAW DERIVATIONS
• By rearranging <i>The Ideal Gas Law</i> we can derive new equations connected to, or
□ These derivations are required when we have <u>variables with 2 sets of different values</u> .
<b>EXAMPLE:</b> A sample of sulfur hexachloride gas occupies 8.30 L at 202 °C. Assuming that the pressure remains constant, what temperature (in °C) is needed to decrease the volume to 5.25 L?
STEP 1: Begin by writing out the Ideal Gas Law Formula.
STEP 2: Circle the variables in the Ideal Gas Law Formula that have two sets of different values.
STEP 3: Cross out the variables in the Ideal Gas Law Formula that are not discussed or are remaining the same.  □ Since the R constant will be the same value we can always ignore it.
STEP 4: Algebraically move all the circled variables to the left side of the Ideal Gas Law Formula.
STEP 5: Make these circled variables equal to the second set of identical variables in order to derive a new formula.  □ If temperature is involved in the calculation, it must be in the SI unit of

CONCEPT: THE IDEAL GAS LAW DERIVATIONS
PRACTICE: A sample of nitrogen dioxide gas at 130 °C and 315 torr occupies a volume of 1750 mL. What will the gas
pressure be if the volume is reduced to 320 mL at 130 °C?
PRACTICE A 15 1 20 11 11 11 12 12 13 0 045 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
<b>PRACTICE:</b> A cylinder with a movable piston contains 0.615 moles of gas and has a volume of 295 mL. What will its
volume be if 0.103 moles of gas escaped?
<b>PRACTICE:</b> On most spray cans it is advised to never expose them to fire. A spray can is used until all that remains is the
propellant gas, which has a pressure of 1350 torr at 25 °C. If the can is then thrown into a fire at 455 °C, what will be the
pressure (in torr) in the can?
