

CONCEPT: BIOLOGICAL MEMBRANES

- Recall: _____ are *amphipathic* molecules & are the major component of *biological membranes*.
 - **Biological Membrane:** phospholipid _____ with other embedded molecules (ex. proteins & cholesterol).
 - Also called _____ membrane or _____ membrane.
- **Fluid Mosaic Model:** *biological membranes* are _____ & a _____ of membrane-embedded *proteins*.
 - Comprised of 20-80% _____ by mass that move *laterally* within the cell membrane.

EXAMPLE: Membranes are a fluid mosaic of what major components?

- Proteins, cholesterol, and sugar.
- Phospholipids, proteins, and cholesterol.
- Phospholipids, nucleic acids, and cholesterol.
- Glucose, proteins, and phospholipids.

PRACTICE: The fluid mosaic model of the membrane proposed that membranes:

- Consist of a single layer of phospholipids and proteins.
- Consist of a phospholipid bilayer composed of a variety of fatty acids.
- Consist of protein molecules embedded in a dynamic bilayer of phospholipids.
- Consist of a phospholipid bilayer between two layers of hydrophilic proteins.
